

FITC-PEG-Mal

Catalogue No.: abx085300

Chemical structure of FITC-PEG-Mal.

Polyethylene glycol (PEG) compounds contain a polyether unit, commonly expressed as $R_1-(O-CH_2-CH_2)_n-O-R_2$. They are generally biocompatible, non-toxic and stable in both organic and aqueous solutions, and so are extensively used in biological applications, as well as nanotechnology and materials research. Proteins with PEG chain modifications and compounds encapsulated in PEG liposomes exhibit a longer half-life *in vivo* than their non-PEGylated counterparts, a phenomenon known as PEG shielding. Functionalised PEG lipids and phospholipids can be used for protein-PEG conjugation.

Target:	FITC-PEG-Mal
Conjugation:	Unconjugated
Note:	This product is for research use only.
