

AMBP Assay Kit

Catalogue No.:abx098467

Alpha-1 Microglobulin Assay Kit is an Assay Kit by Latex Enhanced Method.

This product is used to determine α 1 - MG in human serum or plasma.

The Alpha - 1 - microglobulin in the sample meets its corresponding antibody combined with latex particles in a liquid buffer to occur agglutination reaction and produce turbidity in the linear range. The turbidity is proportional to the concentration of Alpha - 1 - microglobulin in the sample with the presence of an appropriate amount of its corresponding antibodies. Under a certain wavelength, Alpha - 1 - microglobulin concentration in the sample can be calculated by comparing the calibrator result with same processing.
