

XPC Antibody(N-term)
Affinity Purified Rabbit Polyclonal Antibody (Pab)
Catalog # AP19709a

Specification

XPC Antibody(N-term) - Product Information

Application	WB,E
Primary Accession	O01831
Other Accession	NP_001139241.1 , NP_004619.3
Reactivity	Human
Host	Rabbit
Clonality	Polyclonal
Isotype	Rabbit Ig
Antigen Region	154-183

XPC Antibody(N-term) - Additional Information

Gene ID 7508

Other Names

DNA repair protein complementing XP-C cells, Xeroderma pigmentosum group C-complementing protein, p125, XPC, XPCC

Target/Specificity

This XPC antibody is generated from rabbits immunized with a KLH conjugated synthetic peptide between 154-183 amino acids from the N-terminal region of human XPC.

Dilution

WB~~1:2000

Format

Purified polyclonal antibody supplied in PBS with 0.09% (W/V) sodium azide. This antibody is purified through a protein A column, followed by peptide affinity purification.

Storage

Maintain refrigerated at 2-8°C for up to 2 weeks. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.

Precautions

XPC Antibody(N-term) is for research use only and not for use in diagnostic or therapeutic procedures.

XPC Antibody(N-term) - Background

This gene encodes a component of the nucleotide excision repair (NER) pathway. There are multiple components involved in the NER pathway, including Xeroderma pigmentosum (XP) A-G and V, Cockayne syndrome (CS) A and B, and trichothiodystrophy (TTD) group A, etc. This component, XPC, plays an important role in the early steps of global genome NER, especially in damage recognition, open complex formation, and repair protein complex formation. Mutations in this gene or some other NER components result in Xeroderma pigmentosum, a rare autosomal recessive

XPC Antibody(N-term) - Protein Information**Name** XPC**Synonyms** XPCC**Function**

Involved in global genome nucleotide excision repair (GG-NER) by acting as damage sensing and DNA-binding factor component of the XPC complex (PubMed:10734143, PubMed:19609301, PubMed:20649465, PubMed:9734359, PubMed:10873465, PubMed:12509299, PubMed:12547395, PubMed:19941824, PubMed:20028083, PubMed:20798892). Has only a low DNA repair activity by itself which is stimulated by RAD23B and RAD23A. Has a preference to bind DNA containing a short single-stranded segment but not to damaged oligonucleotides (PubMed:10734143, PubMed:19609301, PubMed:20649465). This feature is proposed to be related to a dynamic sensor function: XPC can rapidly screen duplex DNA for non-hydrogen-

disorder characterized by increased sensitivity to sunlight with the development of carcinomas at an early age. Alternatively spliced transcript variants have been found for this gene.

bonded bases by forming a transient nucleoprotein intermediate complex which matures into a stable recognition complex through an intrinsic single-stranded DNA-binding activity (PubMed:10734143, PubMed:19609301, PubMed:20649465). The XPC complex is proposed to represent the first factor bound at the sites of DNA damage and together with other core recognition factors, XPA, RPA and the TFIIH complex, is part of the pre-incision (or initial recognition) complex (PubMed:9734359, PubMed:10873465, PubMed:12509299, PubMed:12547395, PubMed:19941824, PubMed:20028083, PubMed:20798892). The XPC complex recognizes a wide spectrum of damaged DNA characterized by distortions of the DNA helix such as single-stranded loops, mismatched bubbles or single-stranded overhangs (PubMed:9734359, PubMed:10873465, PubMed:12509299, PubMed:12547395, PubMed:19941824

target="_blank">19941824,

target="_blank">20028083,
PubMed:<a href="http://www.uniprot.org/citations/20798892"
target="_blank">20798892). The
orientation of XPC complex binding appears
to be crucial for inducing a productive NER
(PubMed:<a href="http://www.uniprot.org/citations/9734359"
target="_blank">9734359,
PubMed:<a href="http://www.uniprot.org/citations/10873465"

target="_blank">20798892). XPC
complex is proposed to recognize and to
interact with unpaired bases on the
undamaged DNA strand which is followed
by recruitment of the TFIIH complex and
subsequent scanning for lesions in the
opposite strand in a 5'-to-3' direction by the
NER machinery (PubMed:<a href="http://www.uniprot.org/citations/9734359"

target="_blank">20798892).

Cyclobutane pyrimidine dimers (CPDs) which are formed upon UV-induced DNA damage escape detection by the XPC complex due to a low degree of structural perturbation. Instead they are detected by the UV-DDB complex which in turn recruits and cooperates with the XPC complex in the respective DNA repair (PubMed:[9734359](http://www.uniprot.org/citations/9734359)), PubMed:[10873465](http://www.uniprot.org/citations/10873465)), PubMed:[12509299](http://www.uniprot.org/citations/12509299)), PubMed:[12547395](http://www.uniprot.org/citations/12547395)), PubMed:[19941824](http://www.uniprot.org/citations/19941824)), PubMed:[20028083](http://www.uniprot.org/citations/20028083)), PubMed:[20798892](http://www.uniprot.org/citations/20798892)). In vitro, the XPC:RAD23B dimer is sufficient to initiate NER; it preferentially binds to cisplatin and UV-damaged double-stranded DNA and also binds to a variety of chemically and structurally diverse DNA adducts (PubMed:[20028083](http://www.uniprot.org/citations/20028083)). XPC:RAD23B contacts DNA both 5' and 3' of a cisplatin lesion with a preference for the 5' side. XPC:RAD23B induces a bend in DNA upon binding. XPC:RAD23B stimulates the activity of DNA glycosylases TDG and SMUG1 (PubMed:[20028083](http://www.uniprot.org/citations/20028083)).

Cellular Location

Nucleus. Chromosome. Cytoplasm
Note=Omnipresent in the nucleus and consistently associates with and dissociates from DNA in the absence of DNA damage (PubMed:18682493) Continuously shuttles between the cytoplasm and the nucleus, which is impeded by the presence of NER lesions (PubMed:18682493)
