Alternate Names: BMP-11

Description: Growth differentiation factor 11 (GDF11), also known as bone morphogenetic protein 11 (BMP-11), is a regulator of cell growth and differentiation during muscular and neural development. GDF-11 binds the transforming growth factor-beta receptors ALK4, ALK5, and ALK7 to activate SMAD signaling. In adults, exogenous GDF-11 promotes cardiomyocyte regeneration to reverse age-related cardiac hypertrophy. Recombinant human, mouse and rat GDF11 have 100% sequence homology.
