Description Nerve Growth Factor (NGF-beta) is a neurotrophic factor related to BDNF, NT-3 and NT

-4 and is involved in the development and maintenance of the sensory and sympathetic nervous systems. β-NGF signals through the low affinity nerve growth factor receptor (LNGFR) and the tropomyosin receptor kinase A (TrkA) to activate Pl3K, Ras, and PLC signaling pathways. β-NGF is also involved in the growth, differentiation, and survival of

B lymphocytes. Human, mouse, and rat β -NGF proteins are cross-reactive.

Reconstitution: Centrifuge vial prior to opening. When reconstituting the product, gently pipet and

wash down the sides of the vial to ensure full recovery of the protein into solution. It is recommended to reconstitute the lyophilized product with sterile water at a concentration

of 0.1 mg/mL, which can be further diluted into other aqueous solutions.

Storage & Stability: Store as supplied at -20°C to -80°C for up to 1 year. Upon reconstitution, prepare

working aliquots and store at -20°C to -80°C. It is recommended that a carrier protein

Mouse beta-NGF Gel

Figure: 1 ug run under (-) non-reducing conditions and (+) reducing conditions in a 4-20% Tris-Glycine gel, stained with Coomassie Blue. Mouse beta-NGF is a noncovalent homodimer and therefore has a predicted MW of 13.6 kDa when run under both reducing and non-reducing conditions.
