

## Marmoset Bone Marrow Aspirate

**Cat. No.: NHP-BF013**

**This product is for research use only and is not intended for diagnostic use.**

Marmoset monkeys are a kind of small monkeys that mainly inhabit South America. This product is sampled from Rhesus monkeys' bone tissue. The sample is high-quality and offered in a cryopreserved or fresh form and is usually used in a series of test and assay experiments such as PCR, WB, immunoprecipitation, and immunofluorescent flow cytometry.

### Detailed Product Description

<b>Source</b>	Healthy marmoset
<b>Purity</b>	Free of foreign impurities.
<b>Applications</b>	Suitable for various research fields including biomarker research, pharmacology, and toxicology.
<b>Storage Conditions</b>	Store at -20 °C or -80 °C. Avoid freeze-thaw cycle.

### Technical Specifications

<b>Collection Method</b>	Bone marrow aspirate is collected from rigorously screened healthy donors, and the collection process strictly adheres to animal welfare requirements. Obtained from the bone marrow cavity through a special needle, bone marrow aspirate does not contain contamination and serves as a primary source for biomarkers.
<b>Quality Control</b>	Strict accordance with biomedical standards.
<b>Available Formats</b>	Frozen
