

Recombinant Influenza A Virus H3N2 (A/Wisconsin/67/X-161/2005), His-tagged

DAG1692 H3N2

Lot. No. (See product label)

PRODUCT INFORMATION

Product overview H3N2 (A/Wisconsin/67/X-161/2005, ABO37609, 18 a.a. - 530 a.a.) partial recombinant protein with His tag expressed in 293 cells.

Antigen Description Influenza A virus is a major public health threat. Novel influenza virus strains caused by genetic drift and viral recombination emerge periodically to which humans have little or no immunity, resulting in devastating pandemics. Influenza A can exist in a variety of animals; however it is in birds that all subtypes can be found. These subtypes are classified based on the combination of the virus coat glycoproteins hemagglutinin (HA) and neuraminidase (NA) subtypes. Hemagglutinin binds to sialic acid-containing receptors on the cell surface, bringing about the attachment of the virus particle to the cell. It plays a major role in the determination of host range restriction and virulence and is responsible for penetration of the virus into the cell cytoplasm by mediating the fusion of the membrane of the endocytosed virus particle with the endosomal membrane.

Source 293 cells

Species H3N2

Tag His

Form Liquid

Purity > 95% by SDS-PAGE

Applications SDS-PAGE

PACKAGING

Storage Store at 4°C. Do not freeze.

Concentration 1 ug/uL

Buffer In PBS

BACKGROUND

Introduction Influenza A virus subtype H3N2 (also H3N2) is a subtype of viruses that causes influenza (flu). H3N2 Viruses can infect birds and mammals. In birds, humans, and pigs, the virus has mutated into many strains. H3N2 is increasingly abundant in seasonal influenza, which kills an estimated 36, 000 people in the United States each year. In the last half of 2011, a dozen human cases of a new variant of the disease have been found in the USA. This new variant, called H3N2v, appears to be transmissible among humans.

Keywords Influenza A virus subtype H3N2; H3N2
