

M. pneumoniae grade 2 antigen (partially purified) (DAGA-507)

This product is for research use only and is not intended for diagnostic use.

PRODUCT INFORMATION

Antigen Description	Mycoplasma pneumoniae is an "atypical" bacterium (the singular form of bacteria) that commonly causes infections of the respiratory system. It is in the bacteria class Mollicutes. M. pneumoniae is characterized by the absence of a peptidoglycan cell wall and resulting resistance to many antibacterial agents.
----------------------------	---

Purity	Partially purified
---------------	--------------------

Conjugate	Unconjugated
------------------	--------------

Applications	IgG and IgM detection in EIA
---------------------	------------------------------

Format	Liquid
---------------	--------

Concentration	Batch dependent - please inquire should you have specific requirements
----------------------	--

Size	1 ml
-------------	------

Buffer	10mM Phosphate Buffered Saline
---------------	--------------------------------

Preservative	None
---------------------	------

Storage	≤-70°C
----------------	--------

BACKGROUND

Keywords	Mycoplasma pneumoniae antigen;Mycoplasma pneumonia protein;Pneumonia protein
-----------------	--
