Relevance	The protein encoded by this gene is a member of the keratin gene family. As a type II hair keratin, it is a basic protein which heterodimerizes with type I keratins to form hair and nails. The type II hair keratins are clustered in a region of chromosome 12q13 and are grouped into two distinct subfamilies based on structure similarity. One subfamily, consisting of KRT8B1, KRT8B3, and KRT8B6, is highly related. The other less-related subfamily includes KRT8B2, KRT8B4, and KRT8B5. All hair keratins are expressed in the hair follicle; this hair keratin, as well as KRT8B3 and KRT8B6, is found primarily in the hair cortex. Mutations in this gene and KRT8B6 have been observed in patients with a rare dominant hair disease, monilethrix.
