| <b>Relevance</b>           | Promotes orthogonal branching of actin filaments and links actin filaments to membrane glycoproteins. Anchors various transmembrane proteins to the actin cytoskeleton and serves as a scaffold for a wide range of cytoplasmic signaling proteins. Interaction with FLNA may allow neuroblast migration from the ventricular zone into the cortical plate. Tethers cell surface-localized furin, modulates its rate of internalization and directs its intracellular trafficking (By similarity). Involved in ciliogenesis. Plays a role in cell-cell contacts and adherens junctions during the development of blood vessels, heart and brain organs. Plays a role in platelets morphology through interaction with SYK that regulates ITAM- and ITAM-like-containing receptor signaling, resulting in by platelet cytoskeleton organization maintenance (By similarity). |

## Image

IHC image of CSB-RA548809A0HU diluted at 1:100 and staining in paraffin-embedded human cervical cancer performed on a Leica Bond™ system. After dewaxing and hydration, antigen retrieval was mediated by high pressure in a citrate buffer (pH 6.0). Section was blocked with 10% normal goat serum 30min at RT. Then primary antibody (1% BSA) was incubated at 4? overnight. The primary is detected by a Goat anti-rabbit IgG polymer labeled by HRP and

visualized using 0.05% DAB.

## Description

The recombinant FLNA antibody was prepared by obtaining the antibody genes, cloning the genes into a plasma vector to construct vector clone, transfecting the vector clone into a mammalian cell line for transient expression, and purifying the antibody by affinity-chromatography. This recombinant FLNA antibody has been verified to detect the FLNA protein from Human in the ELISA, IHC.

FLNA is an important actin cross-linking protein that attaches actin filaments in smooth muscle cells (SMCs) to transmembrane integrin molecules in focal adhesions of the cell membrane. It thus plays a central role in maintaining cell morphology, cell signaling, cell migration, and adhesion. FLNA mutations have been linked to a wide range of disorders, including bilateral contiguous PVH in females and periventricular nodular heterotopia. Alterations in FLNA expression are responsible for the development and progression of various cancers.
