IFN-γ, Mouse

Cat. No.: Z02916-500

Size: 500.0 ug

Synonyms: Type II interferon, T cell interferon, MAF, IFNG, IFG, IFI

Description:

Sharing 41% sequence identity with human Interferon gamma (hIFN–γ), mouse IFN gamma (mIFN–γ)is a macrophage-activating factor.The active form of IFN–γ is an antiparallel dimer that sets off IFN–γ/JAK/STAT pathway. IFN–γ signaling does diverse biological functions primarily related to host defense and immune regulation, including antiviral and antibacterial defense, apoptosis, inflammation, and innate and acquired immunity.While IFN–γ–induced inflammatory cascade summons a variety of immune-related cell types, such as macrophages, natural killer (NK) cells and cytotoxic T lymphocytes (CTLs), IFN–γ is also implicated in resistance to NK cell and CTL responses and in immune escape in avariety of cancers.

Recombinant mouse IFN gamma (rmIFN-γ) produced in *E. coli* is a non-glycosylated polypeptide chain of 134 amino acids. A fully biologically active molecule, rmIFN–γ has a molecular mass of 15 kDa analyzed by reducing SDS-PAGE and is obtained by proprietary refolding and chromatographic techniques at GenScript.
