

pVectOZ-GFP **(Green Fluorescent Protein Expression Vector)**

Description

The pVectOZ-GFP vector has been created to produce the highest levels of Green Fluorescent Protein expression in a broad range of mammalian cells and tissues. It contains a proprietary modified human cytomegalovirus (CMV) promoter followed by a specific intron, enhancer and a terminator. The expression vector is engineered in an optimized plasmid backbone to achieve the highest levels of transgene expression in mammalian cells and high copy number production in *Escherichia coli*.

Kit contents

Ref. #PL00120
100µg pVectOZ-GFP (encoding for Green Fluorescent Protein) plasmid in 100µl sterile TE buffer.

Storage

Store at -20°C.

Selection Marker

Kanamycin is the selection gene included for producing the plasmid in *Escherichia coli*.

Applications

pVectOZ-GFP (Green Fluorescent Protein) vector is suitable for all transfection applications (*in vitro* & *in vivo*).

Presentation. The transgene expression level depends mainly on the promoter, enhancer, terminator and plasmid backbone. The pVectOZ-GFP expression cassette was designed to express very high levels of transgene product in many mammalian cells and tissues. This vector has been modified to eliminate sequences affecting transgene expression levels while optimizing those critical for high levels of expression. The final expression cassette accommodates the high levels of transgene expression in mammalian cells as well as high yield of plasmid production in *Escherichia coli*. The

resulting plasmid is the ideal vector to reach high levels of expression *in vitro* and *in vivo*.

Use. For high levels of transgene expression in mammalian cells and tissues. For optimal results, this vector can be used with all OZ Biosciences transfection reagents to transfect a wide variety of mammalian cells and tissues.

GFP detection

For transfections performed with pVectOZ-GFP plasmids, the detection can be done by fluorescent (epifluorescence) or confocal microscopy. The GFP produced has an excitation peak at 470-480 nm and emission peak at 510 nm. GFP expression level can also be monitored by fluorescence-activated cell sorter analysis (FACS).
