

Anti-c-Fos antibody

Description Rabbit polyclonal to c-Fos.

Model STJ92249

Host Rabbit

Reactivity Human, Mouse, Rat

Applications ELISA, IHC, WB

Immunogen Synthesized peptide derived from human c-Fos

Immunogen Region 1-80 aa, N-terminal

Gene ID 2353

Gene Symbol FOS

Dilution range WB 1:500-1:2000IHC 1:100-1:300ELISA 1:10000

Specificity c-Fos Polyclonal Antibody detects endogenous levels of c-Fos protein.

Purification The antibody was affinity-purified from rabbit antiserum by affinity-

chromatography using epitope-specific immunogen.

Note For Research Use Only (RUO).

Protein Name Proto-oncogene c-Fos Cellular oncogene fos G0/G1 switch regulatory protein

7

Molecular Weight 50/55 kDa

Clonality Polyclonal

Conjugation Unconjugated

Isotype IgG

Formulation Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Concentration 1 mg/ml

Storage Instruction Store at -20°C, and avoid repeat freeze-thaw cycles.

Database Links <u>HGNC:3796OMIM:164810</u>

Alternative Names Proto-oncogene c-Fos Cellular oncogene fos G0/G1 switch regulatory protein

7

Function Nuclear phosphoprotein which forms a tight but non-covalently linked

complex with the JUN/AP-1 transcription factor. In the heterodimer, FOS and JUN/AP-1 basic regions each seems to interact with symmetrical DNA half sites. On TGF-beta activation, forms a multimeric SMAD3/SMAD4/JUN/FOS complex at the AP1/SMAD-binding site to regulate TGF-beta-mediated signaling. Has a critical function in regulating the development of cells destined to form and maintain the skeleton. It is thought to have an important role in signal transduction, cell proliferation and differentiation. In growing cells, activates phospholipid synthesis, possibly by activating CDS1 and PI4K2A. This activity requires Tyr-dephosphorylation and association with

the endoplasmic reticulum.

Cellular Localization Nucleus. Endoplasmic reticulum. Cytoplasm, cytosol. In quiescent cells,

present in very small amounts in the cytosol. Following induction of cell growth, first localizes to the endoplasmic reticulum and only later to the

nucleus. Localization at the endoplasmic reticulum requires

dephosphorylation at Tyr-10 and Tyr-30.

Post-translational Phosphorylated in the C-terminal upon stimulation by nerve growth factor **Modifications** (NGF) and epidermal growth factor (EGF). Phosphorylated, in vitro, by

MAPK and RSK1. Phosphorylation on both Ser-362 and Ser-374 by

MAPK1/2 and RSK1/2 leads to protein stabilization with phosphorylation on Ser-374 being the major site for protein stabilization on NGF stimulation. Phosphorylation on Ser-362 and Ser-374 primes further phosphorylations on Thr-325 and Thr-331 through promoting docking of MAPK to the DEF domain. Phosphorylation on Thr-232, induced by HA-RAS, activates the

transcriptional activity and antagonizes sumoylation. Phosphorylation on Ser-362 by RSK2 in osteoblasts contributes to osteoblast transformation .

Constitutively sumoylated with SUMO1, SUMO2 and SUMO3. Desumoylated by SENP2. Sumoylation requires heterodimerization with JUN

and is enhanced by mitogen stimulation. Sumoylation inhibits the AP-1 transcriptional activity and is, itself, inhibited by Ras-activated

phosphorylation on Thr-232. In quiescent cells, the small amount of FOS present is phosphorylated at Tyr-10 and Tyr-30 by SRC. This Tyr-phosphorylated form is cytosolic. In growing cells, dephosphorylated by

PTPN2. Dephosphorylation leads to the association with endoplasmic reticulum membranes and activation of phospholipid synthesis.
