

Anti-RA alpha antibody

Description Rabbit polyclonal to RARalpha.

Model STJ95372

Host Rabbit

Reactivity Human, Mouse, Rat

Applications ELISA, IHC, WB

Immunogen Synthesized peptide derived from human RARalpha around the non-

phosphorylation site of S77.

Immunogen Region 20-100 aa

Gene ID <u>5914</u>

Gene Symbol RARA

Dilution range WB 1:500-1:2000IHC 1:100-1:300ELISA 1:10000

Specificity RARalpha Polyclonal Antibody detects endogenous levels of RARalpha

protein.

Purification The antibody was affinity-purified from rabbit antiserum by affinity-

chromatography using epitope-specific immunogen.

Note For Research Use Only (RUO).

Protein Name Retinoic acid receptor alpha RAR-alpha Nuclear receptor subfamily 1 group B

member 1

Molecular Weight 51 kDa

Clonality Polyclonal

Unconjugated Conjugation

Isotype IgG

Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide. **Formulation**

1 mg/ml Concentration

Store at -20°C, and avoid repeat freeze-thaw cycles. **Storage Instruction**

Database Links HGNC:9864OMIM:180240

Retinoic acid receptor alpha RAR-alpha Nuclear receptor subfamily 1 group B **Alternative Names**

member 1

Function Receptor for retinoic acid. Retinoic acid receptors bind as heterodimers to

> their target response elements in response to their ligands, all-trans or 9-cis retinoic acid, and regulate gene expression in various biological processes. The RXR/RAR heterodimers bind to the retinoic acid response elements (RARE) composed of tandem 5'-AGGTCA-3' sites known as DR1-DR5. In

the absence of ligand, the RXR-RAR heterodimers associate with a

multiprotein complex containing transcription corepressors that induce histone acetylation, chromatin condensation and transcriptional suppression. On ligand binding, the corepressors dissociate from the receptors and associate with the coactivators leading to transcriptional activation. RARA plays an essential role in the regulation of retinoic acid-induced germ cell development during spermatogenesis. Has a role in the survival of early spermatocytes at the beginning prophase of meiosis. In Sertoli cells, may promote the survival and development of early meiotic prophase spermatocytes. In concert with RARG, required for skeletal growth, matrix homeostasis and growth plate function. Regulates expression of target genes in a ligand-dependent manner by recruiting chromatin complexes containing KMT2E/MLL5. Mediates

retinoic acid-induced granulopoiesis.

Sequence and Domain Family Composed of three domains: a modulating N-terminal domain, a DNA-

binding domain and a C-terminal ligand-binding domain.

Cellular Localization Nucleus. Cytoplasm. Nuclear localization depends on ligand binding,

phosphorylation and sumoylation. Transloaction to the nucleus in the absence of ligand is dependent on activation of PKC and the downstream MAPK

phosphorylation.

Post-translational

Modifications

Phosphorylated on serine and threonine residues. Phosphorylation does not change during cell cycle. Phosphorylation on Ser-77 is crucial for transcriptional activity. Phosphorylation by AKT1 is required for the repressor activity but has no effect on DNA binding, protein stability nor

subcellular localization. Phosphorylated by PKA in vitro. This

phosphorylation on Ser-219 and Ser-369 is critical for ligand binding, nuclear localization and transcriptional activity in response to FSH signaling. Sumoylated with SUMO2, mainly on Lys-399 which is also required for SENP6 binding. On all-trans retinoic acid (ATRA) binding, a confromational change may occur that allows sumovlation on two additional site, Lys-166 and Lys-171. Probably desumoylated by SENP6. Sumoylation levels determine nuclear localization and regulate ATRA-mediated transcriptional activity.

Trimethylation enhances heterodimerization with RXRA and positively

modulates the transcriptional activation.; Ubiquitinated.
