

Anti-alpha-SMA antibody

Description	Mouse monoclonal to alpha-SMA.

Model STJ97381

Host Mouse

Reactivity Human, Mouse, Rat

Applications IHC, WB

Immunogen Synthetic Peptide

Gene ID 59

Gene Symbol ACTA2

Dilution range WB 1:5000-50000IHC 1:1000-2000

Specificity The antibody detects endogenous alpha-SMA protein.

Purification The antibody was affinity-purified from mouse ascites by affinity-

chromatography using epitope-specific immunogen.

Clone ID 1E+12

Note For Research Use Only (RUO).

Protein Name Actin, aortic smooth muscle Alpha-actin-2 Cell growth-inhibiting gene 46

protein Actin, aortic smooth muscle, intermediate form

Clonality Monoclonal

Conjugation Unconjugated

Isotype IgG1

Formulation Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Storage Instruction Store at -20°C, and avoid repeat freeze-thaw cycles.

Database Links HGNC:130OMIM:102620

Alternative Names Actin, aortic smooth muscle Alpha-actin-2 Cell growth-inhibiting gene 46

protein Actin, aortic smooth muscle, intermediate form

Function Actins are highly conserved proteins that are involved in various types of cell

motility and are ubiquitously expressed in all eukaryotic cells.

Cellular Localization Cytoplasm, cytoskeleton.

Post-translational Oxidation of Met-46 and Met-49 by MICALs (MICAL1, MICAL2 or **Modifications** MICAL3) to form methionine sulfoxide promotes actin filament

depolymerization. MICAL1 and MICAL2 produce the (R)-S-oxide form. The (R)-S-oxide form is reverted by MSRB1 and MSRB2, which promote actin repolymerization. Monomethylation at Lys-86 (K84me1) regulates actin-myosin interaction and actomyosin-dependent processes. Demethylation by ALKBH4 is required for maintaining actomyosin dynamics supporting normal cleavage furrow ingression during cytokinesis and cell migration. (Microbial infection) Monomeric actin is cross-linked by V.cholerae toxins RtxA and VgrG1 in case of infection: bacterial toxins mediate the cross-link between Lys-52 of one monomer and Glu-272 of another actin monomer, resulting in

formation of highly toxic actin oligomers that cause cell rounding . The toxin can be highly efficient at very low concentrations by acting on formin homology family proteins: toxic actin oligomers bind with high affinity to formins and adversely affect both nucleation and elongation abilities of formins, causing their potent inhibition in both profilin-dependent and

independent manners.
