

Anti-alpha-tubulin (Acetyl Lys40) antibody

Western Blot (WB) analysis of 1. HeLa cells, untreated (-) 2. HeLa cells treated with TSA (1μM, 18 hr+) cells using alpha-tubulin (Acetyl Lys40) Monoclonal Antibody(4A8). (STJ97537)

Description

Tubulin alpha is a protein encoded by the TUBA1A gene which is approximately 50,1 kDa. Tubulin alpha is localised to the cytoplasm. It is involved in the regulation of PLK1 activity at G2/M transition, development Slit-Robo signalling, the mitotic cell cycle and chaperonin-mediated protein folding. This protein falls under the tubulin family. Tubulin is the major constituent of microtubules which perform essential and diverse functions within the eukaryotic cytoskeleton. It binds two moles of GTP, one at an exchangeable site on the beta chain and one at a non-exchangeable site on the alpha chain. Tubulin alpha is expressed at high levels in the foetal brain. Mutations in the TUBA1A gene may result in lissencephaly. STJ97537 was developed from clone 4A8 and was affinity-purified from mouse ascites by affinity-chromatography using specific immunogen. This antibody detects endogenous tubulin alpha proteins.

Model STJ97537

Host Mouse

Reactivity Human, Mouse, Rat

Applications IHC, WB

Immunogen Synthetic Peptide

Gene ID [10376](#)

Gene Symbol [TUBA1B](#)

Dilution range WB 1:1000-2000IHC 1:50-100

Specificity alpha-tubulin (Acetyl Lys40) Mouse Monoclonal Antibody (4A8) detects endogenous levels of alpha-tubulin (Acetyl Lys40)

Purification	The antibody was affinity-purified from mouse ascites by affinity-chromatography using specific immunogen.
Clone ID	4A8
Note	For Research Use Only (RUO).
Protein Name	Tubulin alpha-1B chain Alpha-tubulin ubiquitous Tubulin K-alpha-1 Tubulin alpha-ubiquitous chain Detyrosinated tubulin alpha-1B chain
Clonality	Monoclonal
Conjugation	Unconjugated
Isotype	IgG1
Formulation	Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.
Concentration	1 mg/ml
Storage Instruction	Store at -20°C, and avoid repeat freeze-thaw cycles.
Database Links	HGNC:18809OMIM:602530
Alternative Names	Tubulin alpha-1B chain Alpha-tubulin ubiquitous Tubulin K-alpha-1 Tubulin alpha-ubiquitous chain Detyrosinated tubulin alpha-1B chain
Function	Tubulin is the major constituent of microtubules. It binds two moles of GTP, one at an exchangeable site on the beta chain and one at a non-exchangeable site on the alpha chain.
Cellular Localization	Cytoplasm, cytoskeleton.
Post-translational Modifications	<p>Some glutamate residues at the C-terminus are polyglutamylated, resulting in polyglutamate chains on the gamma-carboxyl group . Polyglutamylation plays a key role in microtubule severing by spastin (SPAST). SPAST preferentially recognizes and acts on microtubules decorated with short polyglutamate tails: severing activity by SPAST increases as the number of glutamates per tubulin rises from one to eight, but decreases beyond this glutamylation threshold .</p> <p>Some glutamate residues at the C-terminus are monoglycylated but not polyglycylated due to the absence of functional TTL10 in human. Monoglycylation is mainly limited to tubulin incorporated into axonemes (cilia and flagella). Both polyglutamylation and monoglycylation can coexist on the same protein on adjacent residues, and lowering glycylation levels increases polyglutamylation, and reciprocally. The precise function of monoglycylation is still unclear (Probable). Acetylation of alpha chains at Lys-40 is located inside the microtubule lumen. This modification has been correlated with increased microtubule stability, intracellular transport and ciliary assembly. Methylation of alpha chains at Lys-40 is found in mitotic microtubules and is required for normal mitosis and cytokinesis contributing to genomic stability. Nitration of Tyr-451 is irreversible and interferes with normal dynein intracellular distribution. Undergoes a tyrosination/detyrosination cycle, the cyclic removal and re-addition of a C-terminal tyrosine residue by the enzymes tubulin tyrosine carboxypeptidase (TTCP) and tubulin tyrosine ligase (TTL), respectively. Tubulin alpha-1B chain: Tyrosination promotes microtubule interaction with CAP-Gly domain-containing proteins such as CLIP1, CLIP2 and DCTN1 . Tyrosination regulates the initiation of dynein-dynactin motility via interaction with DCTN1, which brings the dynein-dynactin complex into contact with</p>

microtubules . In neurons, tyrosinated tubulins mediate the initiation of retrograde vesicle transport . Detyrosinated tubulin alpha-1B chain: Detyrosination is involved in metaphase plate congression by guiding chromosomes during mitosis: detyrosination promotes interaction with CENPE, promoting pole-proximal transport of chromosomes toward the equator . Detyrosination increases microtubules-dependent mechanotransduction in dystrophic cardiac and skeletal muscle. In cardiomyocytes, detyrosinated microtubules are required to resist to contractile compression during contraction: detyrosination promotes association with desmin (DES) at force-generating sarcomeres, leading to buckled microtubules and mechanical resistance to contraction .
