

## **Anti-E2F-1 antibody**

**Description** E2F-1 is a protein encoded by the E2F1 gene which is approximately 46,9

kDa. E2F-1 is localised to the nucleus. It is involved in glioma, cyclins and cell cycle regulation and activation of BH3-only proteins. It plays a crucial role in the control of cell cycle and action of tumor suppressor proteins and is also a target of the transforming proteins of small DNA tumor viruses. E2F-1 is expressed in the skin, pancreas and the nervous system.

Mutations in the E2F1 gene may result in retinoblastoma

pharyngoconjunctival fever. STJ98642 was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen.

This antibody detects endogenous levels of E2F-1.

Model STJ98642

**Host** Rabbit

**Reactivity** Human, Mouse, Rat

**Applications** ELISA, WB

**Immunogen** Synthetic peptide from AA range: 100-170.

**Immunogen Region** 100-170 aa

Gene ID 1869
Gene Symbol E2F1

**Dilution range** WB 1:5000-10000ELISA 1:10000

**Specificity** The antibody detects endogenous E2F-1 protein

**Purification** The antibody was affinity-purified from rabbit serum by affinity-

chromatography using specific immunogen.

**Note** For Research Use Only (RUO).

Protein Name Transcription factor E2F1 E2F-1 PBR3 Retinoblastoma-associated protein 1

RBAP-1 Retinoblastoma-binding protein 3 RBBP-3 pRB-binding protein

E2F-1

**Clonality** Polyclonal

**Conjugation** Unconjugated

**Isotype** IgG

**Formulation** PBS, pH 7.4, containing 0.02% sodium azide as Preservative and 50%

Glycerol.

**Concentration** 1 mg/ml

**Storage Instruction** Store at -20°C, and avoid repeat freeze-thaw cycles.

Database Links HGNC:3113OMIM:189971

Alternative Names Transcription factor E2F1 E2F-1 PBR3 Retinoblastoma-associated protein 1

RBAP-1 Retinoblastoma-binding protein 3 RBBP-3 pRB-binding protein

E2F-1

**Function** Transcription activator that binds DNA cooperatively with DP proteins

through the E2 recognition site, 5'-TTTC[CG]CGC-3' found in the promoter region of a number of genes whose products are involved in cell cycle regulation or in DNA replication. The DRTF1/E2F complex functions in the

control of cell-cycle progression from G1 to S phase. E2F1 binds

preferentially RB1 in a cell-cycle dependent manner. It can mediate both cell

proliferation and TP53/p53-dependent apoptosis. Blocks adipocyte

differentiation by binding to specific promoters repressing CEBPA binding to

its target gene promoters.

Cellular Localization Nucleus.

**Post-translational** Phosphorylated by CDK2 and cyclin A-CDK2 in the S-phase.

Modifications Phosphorylation at Ser-364 by CHEK2 stabilizes E2F1 upon DNA damage

and regulates its effect on transcription and apoptosis. Acetylation stimulates DNA-binding. Enhanced under stress conditions such as DNA damage and inhibited by retinoblastoma protein RB1. Regulated by KAP1/TRIM28 which

recruits HDAC1 to E2F1 resulting in deacetylation. Acetylated by

P/CAF/KAT2B.
