Biological Description

Description	Compared to fluorescein labeling reagents such as FITC and FAM, CR110 reagents give more photostable and pH-independent bioconjugates that have the absorption maximum around the preferred 488 nm excitation wavelength. They are photostable alternative reagents superior to FITC and FAM.
In vitro	5(6)-CR110, SE, a amine-reactive fluorescent probe for preparation of bioconjugates, is more less pH sensitive (between 4-9) and photo-stable than fluorescein. The labeled conjugated probes can be used for Fluorescence Correlation Spectroscopy (FCS).
