Biological Description

Description	Nafcillin sodium monohydrate (CL 8491) is the sodium salt form of nafcillin, a semi-synthetic naphthalene, penicillin-related Nafcillin inhibits bacterial wall synthesis by a mechanism of action similar to penicillin. Penicillinase-resistant Nafcillin is used to treat infections caused by penicillin-resistant strains of Staphylococci.
Targets(IC50)	Antibacterial,Antibiotic
In vivo	Nafcillin sodium inactivates beta-lactamase by forming a covalent acyl-enzyme intermediate with Ser-70. At concentrations greater than 80 mM, and exposure times less than 200 seconds, Nafcillin completely inhibits the activity of beta-lactamase. Upon removal of Nafcillin, the inhibited enzyme can be fully reactivated with a rate constant of $2 \times 10^{-3}/s$ at 25°C.
