Biological Description

Description	Ipragliflozin (ASP1941) is under investigation in Type 2 Diabetes and Diabetes Mellitus, Type 2.
Targets(IC50)	SGLT
Kinase Assay	Inhibition of TNF- α synthesis: TNF- α inhibitory activity is measured in lipopolysaccharide (LPS) stimulated PBMC. Pomalidomide is added to human PBMCs 1 hour prior to the addition of LPS (1 μ g/mL) and incubation continued for an additional 18-20 hours. Supernatants are then harvested, and the concentration of TNF- α in the supernatants is determined by ELISA. The concentration of Pomalidomide that inhibits TNF- production by 50% (IC50) is calculated by nonlinear regression analysis. The human whole blood TNF- inhibition assay is run in a similar fashion to the PBMC assay except that heparinized fresh human whole blood is plated directly into microtiter plates.
